

# Technology development and manufacturing for 3<sup>rd</sup> Gen solar cells

***Coatema***

13/06/2023

MEMBER OF ATH

# Agenda

1. Introduction
2. 3<sup>rd</sup> Gen solar technology
3. Flex2Energy project
4. Process control
5. Slot die coating for 3<sup>rd</sup> Gen PV
6. Drying technologies for 3<sup>rd</sup> Gen PV
7. Today`s equipment for 3<sup>rd</sup> Gen PV
8. Summary

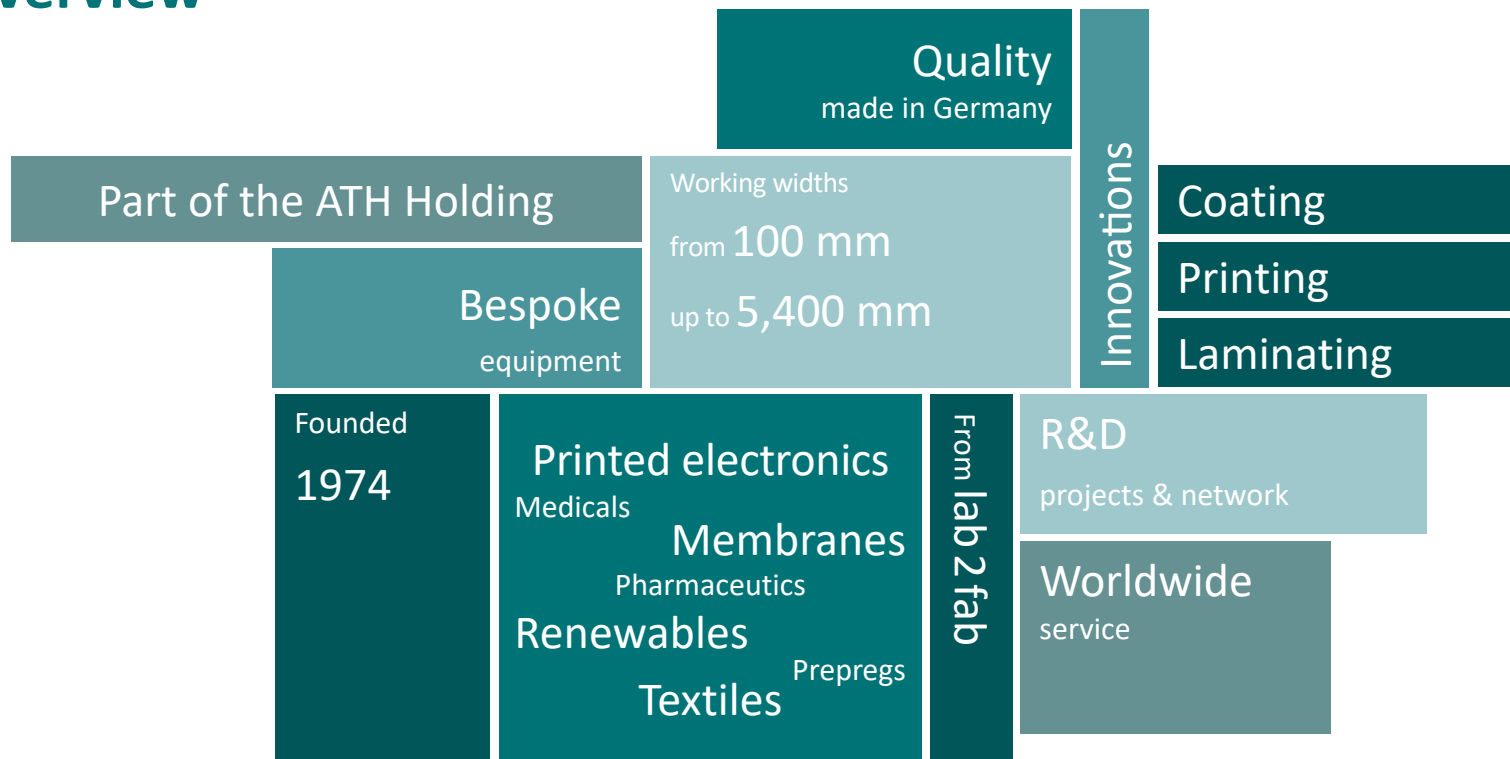

# 1.

## Introduction

## Overview

## Group of companies

**ATH** ALTONAER  
TECHNOLOGIE  
HOLDING

- ✓ Founded 1903
- ✓ Approx. 200 employees
- ✓ Located in Hamburg

**DRY/TEC**

- ✓ Founded 1995
- ✓ Approx. 50 employees
- ✓ Located in Norderstedt

- ✓ Founded 1974
- ✓ Approx. 50 employees
- ✓ Located in Dormagen

## Coatema focus areas

Green Hydrogen

Fuel Cells

Batteries

Solar

Sustainability

Digital fabrication

Printed  
electronics

The next thing

## R&D customers

## R&D projects overview 2022 – 2023

In-line and real-time digital nano-characterization for flexible organic electronics

### NOUVEAU PROJECT

The NOUVEAU project will develop solid oxide cells (SOCs) with innovative La- and PMG-free electrode materials

R2R production line for OPV solar with integrated backend

Development of near-field electro hydrodynamic nanowire printing

Implementation of laser drying processes for lithium-ion battery production

R2R process optimization for solid state batteries

Plasmonically enhanced photocatalysis for wastewater treatment

### RetroWin

R2R Process and machinery development for retrofit window films for lower production costs

The WaterProof project aims at developing an electrochemical process that converts CO<sub>2</sub> emission

Creating an open-innovation testbed for sustainable packaging

# 2.

## 3<sup>rd</sup> Gen solar technology

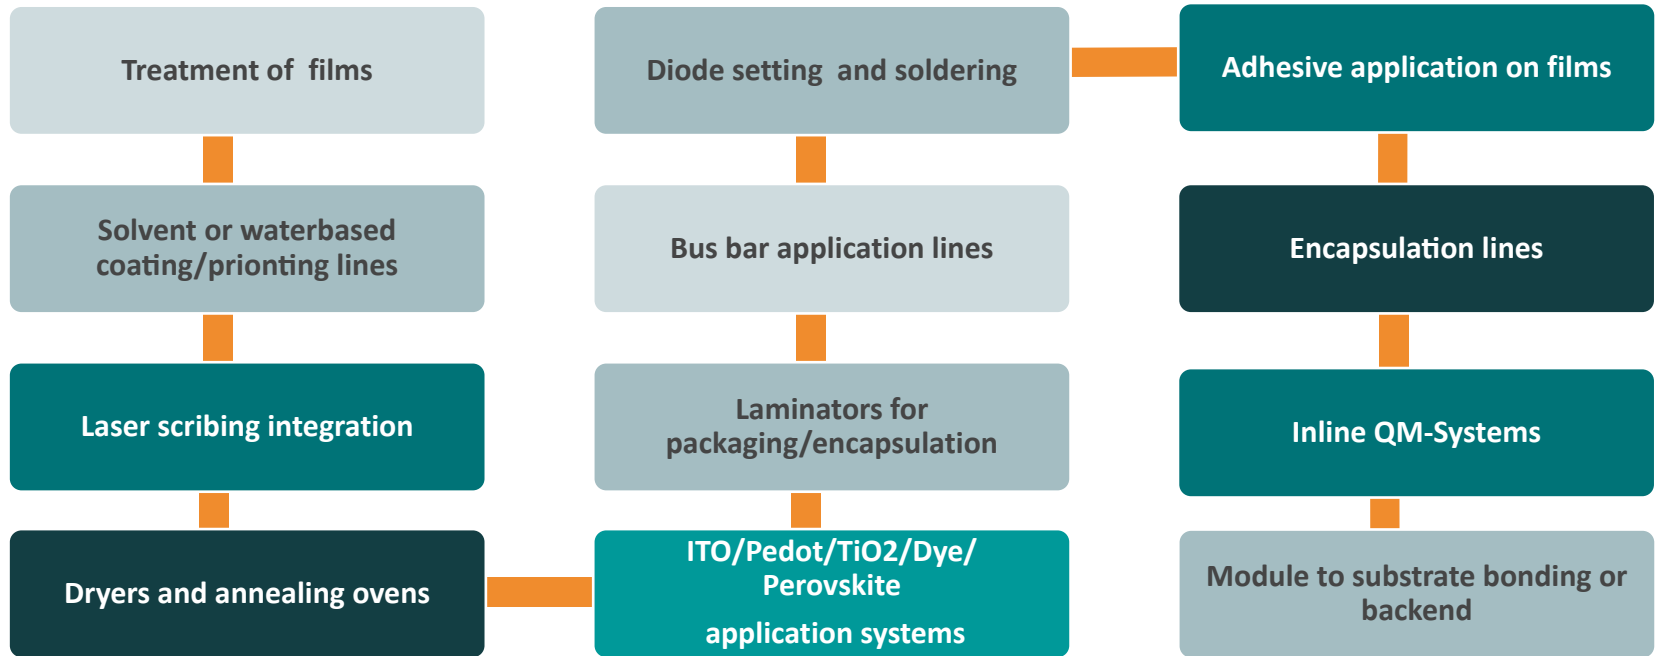

## Overview of the different solar cell types

Technology	Advantage	Challenge
<b>a-Si</b>	Excellent for BIPV due to a proven life time longer than 10 years	Light-induced degradation, Efficiency, Cost for production equipment
<b>CIS/CIGS</b>	Low cost, Efficiency, R2R processes	Availability of Indium
<b>CdTe</b>	Efficiency, life time, stability, well developed, economical production costs	Heavy metal Cadmium
<b>DSSC</b>	low weight, R2R, good performance in diffuse light conditions, real flexible, low cost production methods	Device stability, life time, efficiency
<b>Polymer</b>	Lightweight, flexible, low cost coating or printing methods	Efficiency, device stability, life time
<b>Perovskite</b>	Lightweight, high efficiency from the beginning	Lead layer and lifetime

## Production chain modules

## Cell efficiency

## Cell efficiency for 3rd Gen solar

## Module efficiency

## OPV USP

- ✓ Flexible
- ✓ Low cost
- ✓ High volume R2R processes
- ✓ Thin
- ✓ Light weight
- ✓ Versatile applications
- ✓ Green mobile power
- ✓ Sexy

<b>Encapsulation</b> (Glass or barrier film)
<b>Anode</b> 50 nm – 10µm Solution-processed metals (such as Silver)
<b>Hole transport layer</b> 30 – 100 nm
<b>Photoactive Layer</b> 80 – 300 nm
<b>Cathode</b>
<b>Transparent Electrode</b> 50 nm – 1µm (Solution-processed ZnOx)
<b>Substrate</b> (Transparent ITO or metal oxides plastic film (i.e. PET, PEN)

### Conductive solution with

- Conductive polymer
- Matrix material
- Additives
- Co-solvents

### Bulk heterojunction with

- ✓ Polymer p-type (P3HT)
- ✓ Fullerene n-type (C60 PCBM)
- ✓ Aromatic solvents

## Perovskite, the 3<sup>rd</sup> wave of 3<sup>rd</sup> gen solar

## Coatema Core Technologies in solar technologies

**Dye sensitized  
solar cell  
(DSSC)**

**Organic  
photovoltaics  
(OPV)**

**Perovskite**

**Slot die  
coating/  
Printing  
processes**

**Process inline  
control**

**Drying/  
Annealing**

**Encapsulation**

**Backend**

## 1999 – Vision on flexible roofing integrated PV

Solar Integrated Technologies strategic partnership with Uni-Solar, provides SIT with up to 30MW annually of flexible Photovoltaic cells

Worlds Largest flexible Amorphous Silicon Photovoltaic Cell Production Line. A Three year, \$100 million dollar commitment

## 1999 – flexible PV on roofing membrane

Production facility in Los Angeles

## Vision on flexible roofing integrated PV on roofing membrane

## Vision on flexible roofing integrated PV on roofing membrane

## 1999 – flexible PV on roofing membrane

## Solar cell projects at Coatema

2005 – 2023

## Process upscaling – Developing 3<sup>rd</sup> Gen PV at Coatema

✓ 3 BMWF Projects with Ruhr Uni Bochum and ILT: FlexLAS – Photonflex – Effilayers

✓ 1 REGAC project – LS09 Registration improvement on the MAXI Line at VTT

OPV equipment outside of funded projects

G24i, Solarpower, CSEM, VTT-LS09 MAXILINE, UNSW, CSRIO

CSEM, Eight Nineteen, Heliatek

## Developed and integrated technologies in 3<sup>rd</sup> Gen PV

- ✓ Inert pilotcoater design
- ✓ Slot die coating
- ✓ Screen printing, gravure and flexo printing
- ✓ Laser integration
- ✓ Inkjet integration
- ✓ Registration control
- ✓ Inline quality control
- ✓ Inline layer performance control
- ✓ Nanoimprint surface modification

## Process feasibility study – function & design study

### Lab scale

A4

#### Process specification

- Machinery
- Fluid

#### Defining optim. dilution

50 % → 70 %

- Coating
- Drying
- Curing

#### Defining optim. layer thickness

3  $\mu\text{m}$   $\pm$  0,2  $\mu\text{m}$

#### Adjustment, testing initiators

→ UV LED 365 nm

50 mm; 1 – 5 m/min !

#### Trials

- Quality
- Speed
- Curing
- Thickness

#### Defining Pilot-line set up for coating, lamination

CC08

#### Transfer to CC08

### Pilot scale

200 mm; 1 m/min

## Process & Equipment specifications

- ✓ Suitable R2R coating and lamination solutions at COA will be defined / evaluated

## Process & Ink development

- ✓ Testing defined coating/ process parameter at R&D centre COA
- ✓ Ink & Process optimization
- ✓ Defining most suitable R2R process

## Upscale to production in the Coatema R&D centre

### Process integration

- ✓ Integration into a single R2R process suitable for the production of the OPV modules → Further optimization ink formulation
- ✓ The boundaries of the R2R process regarding quality, speed and costs

### Demonstration and evaluation

- ✓ Production final R2R window film & comparison to the initial S2S ClimAdT film
- ✓ Was the transfer from lab-to-pilot scale successful?
- ✓ Process equipment / Plant for Flex2Energy
- ✓ Design of a suitable R2R pilot line (500 mm)

## Proof of production process in Greece – Flex2Energy

### Process integration as industrial standard

- ✓ Integration into a single R2R process suitable for the production of the OPV modules
- ✓ Integration of backend

### Demonstration and evaluation

- ✓ Production of 3<sup>rd</sup> Gen OPV
- ✓ Licensing the overall giga fab concept

## The vision from NASA – perovskite on the moon

What would it take to manufacture Perovskite Solar Cells in space? | ACS Energy Letters

Source: Author: Lindsey Mc Millon-Brown

# 3.

## Flex2Energy Project

## Flex2Energy (submission 04/2022; start beginning 2023)

- ✓ **Call:** HORIZON-CL5 2022-D3-01-03:Advanced manufacturing of Integrated PV
- ✓ **Project aim:** boost Integrated Photovoltaics manufacturing and the reliability
- ✓ New R2R pilot-to-production line with integrating smart, cognitive and adaptive in-line sensors and actuators for quality control with Artificial Intelligence (AI)-based analysis

### ✓ Partners

## Market opportunities and volume

Global OPV Market is estimated to reach up to 366 M\$ by 2026 and there are few key-players that open the market today

- ✓ CSEM, sunew, Brasil
- ✓ Rayenergy, PRC
- ✓ Heliatek, Germany
- ✓ ARMOR, France

## Innovation F2E – OPV products

- ✓ Highly efficient OPV products easily adaptable in buildings, automotive, agriculture and infrastructure
- ✓ Sophisticated architectures of novel nano-layers from organic semiconductors (electron donors and acceptors), transparent electrodes and inorganic electrodes
- ✓ Can be printed on transparent flexible polymer substrates
- ✓ OPV panels with increased uniformity, power output of **90 W/m<sup>2</sup>**, high **transparency >60 %** and improved **lifetime >20 years** and unique uniform and homogeneous design

### 3<sup>rd</sup> Generation PVs

- ✓ High and tunable optical transparency
- ✓ Lightweight & flexible structure
- ✓ Large-scale production by R2R Printing Process that is less Energy Demanding, Cheaper and Eco-Friendly
- ✓ Free-form design and color uniformity
- ✓ Recycleability

## The novel idea of Flex2Energy

- ✓ Revolutionize the renovation & construction wave of the EU's building industry (buildings, infrastructure, greenhouses and automotive) of all kinds of uses and locations
  - Implementation of novel IPV products for energy positive building concept (Fig. 1)
- ✓ Spread novel IPV products through the setup of a strong Innovation Clusters Network (ICN) in green buildings agriculture and transportation to form and connect this Value Chain of 40 ICs across Europe (Construction, Architects, Designers, Engineers, Contractors, Suppliers, end users etc.)
- ✓ Demonstrate, evaluate, spread and ultimately replicate the developed innovations

**Fig. 1.** F2E automated Manufacturing line for OPVs and IPV products to open the way for energy positive buildings & to minimize landscape

## Ambition

- ✓ The European industry needs to regain its position as a global leader in the manufacturing of high-tech materials, components, and products, such as Photovoltaics (PVs)
- ✓ The global Building Integrated Photovoltaics (BIPV) market was valued at **12,8 B€ in 2020**
- ✓ and is projected to reach **79,4 B€ by 2030**, growing at a CAGR of 20.1% from 2021 – 2030 [1].
- ✓ **Europe as a global leader in manufacturing Organic Electronics (OE) materials, components, and products, mainly Organic Photovoltaics (OPVs) for energy.**

[1] E. P. Anil Chaudhary, "Global BIPV Market," 2021. [Online]. Available: <https://www.alliedmarketresearch.com/building-integrated-photovoltaic-market>

## State of the art – OPVs

- ✓ IPVs = Potential to produce electricity on site, directly from the sun, without concern for energy supply or environmental harm
- ✓ The existing BIPV solutions have a significant number of drawbacks that limit the widespread deployment of energy generating building elements in existing and new construction concepts

**1<sup>st</sup> Generation (OPV)**

- ✓ No optical transparency
- ✓ High weights (~20 kg), heavy structure
- ✓ Not Applicable in Greenhouse roofs due to limited Transparency
- ✓ Efficiency is reduced abruptly in vertical-90° placement  
→ can not cover the energy demands of building

**2<sup>nd</sup> Generation (PV)**

- ✓ Optical transparency but limited up to 30 %
- ✓ High weight increases CO2 footprint
- ✓ High fabrication costs due to current production technology (Vacuum deposition)
- ✓ Constant change of the orientation while being in motion results in decreased performance

## Application example – Agrivoltaic systems

## Agrivoltaics

**Environmental impact and carbon emissions Demand and challenges in Greenhouse sector**

- ✓ Energy consumption in a greenhouse could reach up to 50 % of the total production cost (e.g. due to large heating/cooling costs in winter/summer)
- ✓ Energy is consumed in **heating, cooling and ventilation systems, LED grow light, automations, sensing, distance monitoring, irrigation systems and control systems**
- ✓ Thermal heating demand represents ~ 80 % of the energy consumption, while electricity the 15 %
- ✓ Indicative average energy consumption for a greenhouse in Spain ranges 30 to 70 kWh/m<sup>2</sup>
- ✓ RES for facilitating rational and sustainable farming are necessary
- ✓ Demand for integration of **new and smart technologies**
- ✓ Growing need for energy autonomy

Argivoltaics  
Sustainable **Green** Development

- The Co-location of PVs and Crops in the same area could minimize land impact
- Clean Energy Production- Increase of Crop Production
- Shading and Cooling Effect
- Land and Water use efficiency
- Increase income

anoflexology

NANOTECHNOLOGY 2022 Special Workshop: Agrivoltaics 07/07/2022

## Expected market grow for Agrivoltaics

- ✓ Global installed Agri-PV capacity has increased exponentially from 5 MW in 2012 to 14 GW in 2021 (Expected reach of 97 GW in 2027)
- ✓ The global agrivoltaic market will grow at a CAGR of ~38 % (2022 – 27)
- ✓ Due to rapid climate changes create huge challenges for energy & agriculture worldwide
- ✓ The shift focus toward adopting agrivoltaics to enable the effective use of sunlight for crop growth

# 4.

## Process control

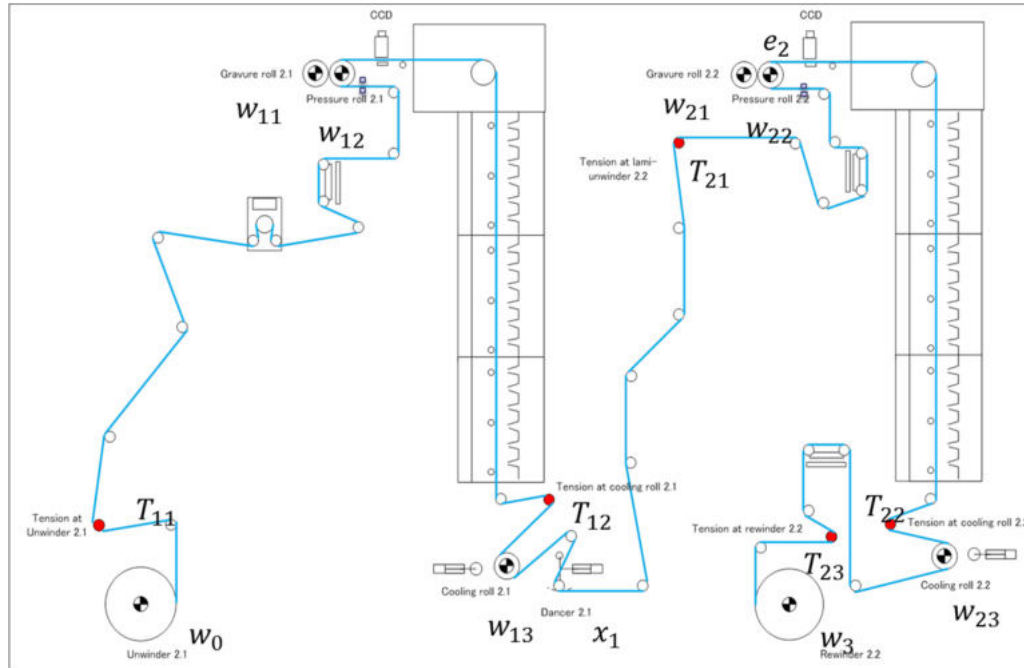

## Technologies & processes – process parameters

Process parameters are:

- ✓ Operation speed
- ✓ Rheology of coating and printing inks
- ✓ Substrate condition
- ✓ Tension control MD / CD
- ✓ Edge control
- ✓ Resolution and registration accuracy of printing / laminating systems
- ✓ Precision of coating operations
- ✓ Curing / drying / crosslinking

# Inline process control

## Processes

## Inline process integration

### Tension control

- ✓ Load cell
- ✓ Segmented load cell
- ✓ Dancer
- ✓ Pulling devices
- ✓ Design of drives

### Registration control

- ✓ Camera
- ✓ Fiber optic
- ✓ Design of drives
- ✓ Algorithm control

### Edge guide control

- ✓ Different sensors
- ✓ Mechanical stress
- ✓ Data collection

### Process analysis

- ✓ Statistic parameters
- ✓ Product flow analysis
- ✓ Yield
- ✓ Cost of ownership
- ✓ Artificial intelligence

### Quality control

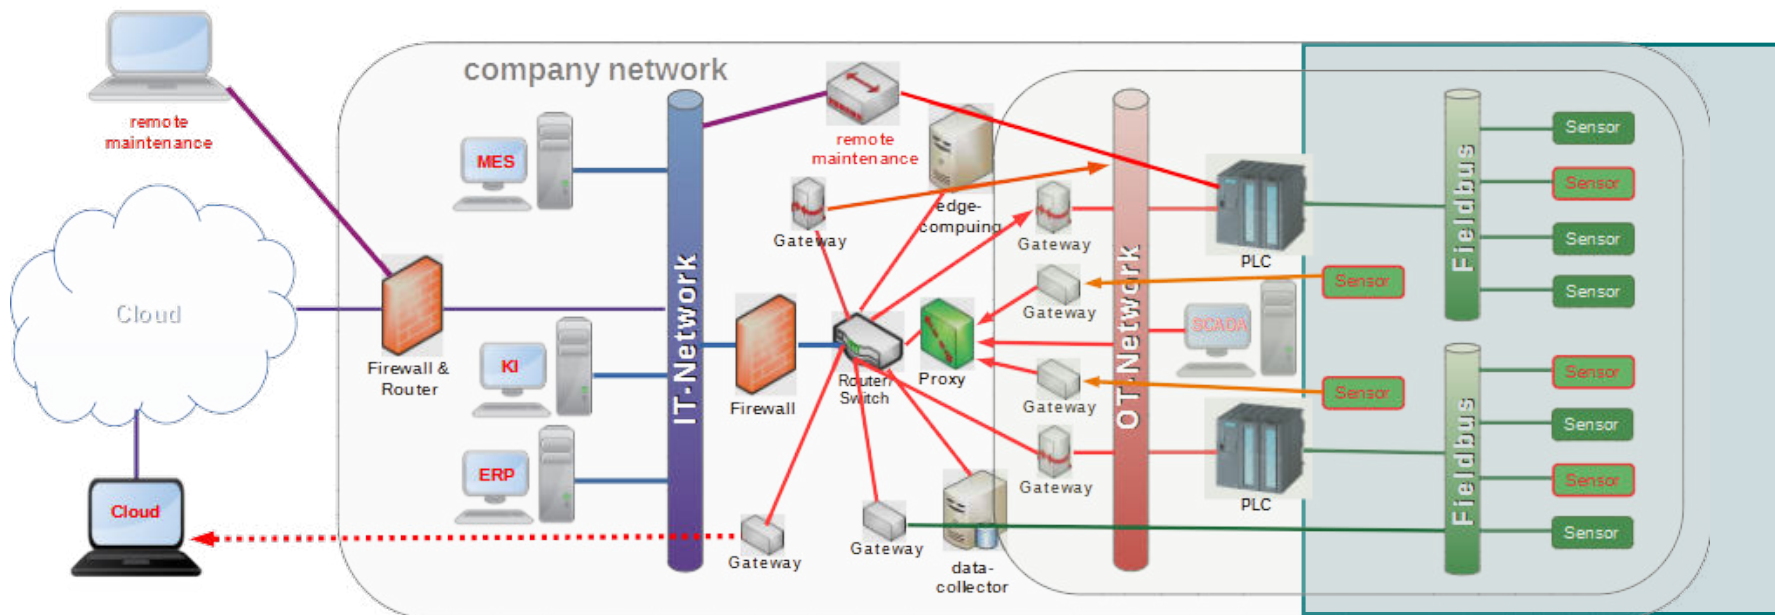

- ✓ Particle contamination analysis
- ✓ Defect detection
- ✓ Thickness control
- ✓ Function control of the device or layer
- ✓ Big data (Cloud)
- ✓ IoT
- ✓ AI / ML

in der speed / Diameter / Cross position / tension / particle contermination / substrate defects / registration marks

## Complexity introduced through connectivity

Heterogeneous connectivity landscape:  
complex, prone for errors, multiple penetration points, difficult to maintain, ....

# AI / Industry 4.0 / IOT & processes – Solution based approach

**Monitoring**  
Sensors and Logs (e.g. torque, vibrations, documentation, maintenance manuals, ...)

## Detection

Analysis of specific system states (e.g. characteristic frequencies)

## Diagnostics

Root cause analysis (e.g. damaged bearings, clogged filter, ...)

## Control

Maintaining productivity (e.g. increasing viscosity)

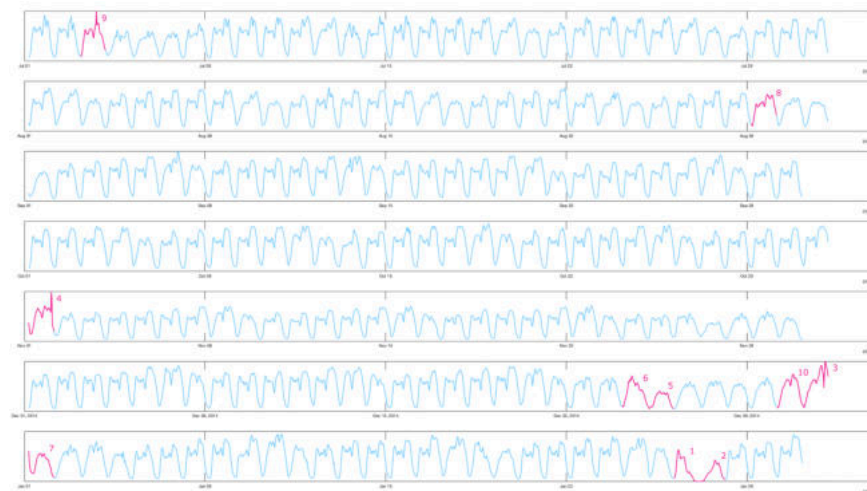

## Prediction

Spare parts and maintenance (next service, service tasks, ...)

## Automatic anomaly detection for time series

## ... what the algorithm is doing

# 5.

## Slot die coating for 3<sup>rd</sup> Gen PV

## Coating parameters

Ink properties	Coating processes	Process control	Drying
<ul style="list-style-type: none"> <li>✓ Rheology</li> <li>✓ Viscosity</li> <li>✓ Viscoelasticity</li> <li>✓ Type of solvents</li> <li>✓ Solid content</li> <li>✓ Van der Waals force</li> <li>✓ Sheer ratio</li> <li>✓ Adhesion/Cohesion</li> </ul>	<ul style="list-style-type: none"> <li>✓ Coating systems</li> <li>✓ Single or multilayer coatings</li> <li>✓ Direct coatings</li> <li>✓ Transfer (indirect) coatings</li> <li>✓ Substrate speed</li> <li>✓ Layer thickness</li> <li>✓ Coating accuracy</li> </ul>	<ul style="list-style-type: none"> <li>✓ Process layout</li> <li>✓ Tension control system</li> <li>✓ Material guiding system</li> <li>✓ Inline parameter control</li> <li>✓ Quality control</li> </ul>	<ul style="list-style-type: none"> <li>✓ Convection drying</li> <li>✓ Contact drying</li> <li>✓ Infrared drying</li> <li>✓ Sintering</li> <li>✓ NIR</li> <li>✓ High frequency</li> <li>✓ UV crosslinking systems</li> </ul>

## Basics of slot die coating – range of parameters

### Coating speed

✓ 0.1 – >1000 m/min

### Ink viscosity

✓ 1 – 300 000 mPas

### Layer thickness (dry)

✓ 0.1 – >200 µm

### Coating accuracy

✓ <1% (2 – 5%)

### Coating width

✓ up to approx. 3 m

## Basic principle

## Basic principle

## Basic principle

## Bead mode

- ✓ Meniscus is formed between die lips and substrate
- ✓ Adhesive stabilization of meniscus by die lips
- ✓ Very low minimum flow rate possible
- ✓ For a stable process the range of rheological parameters is limited
- ✓ Preferably for low coating speed

## 2 + 2 = 3 aspects of slot die coating

## Theoretical background

Contrary to a widespread misunderstanding the wet coating thickness does not depend on the shim thickness.

Shim thickness and distance to substrate only help to stabilize the meniscus.

## Calculation of the meniscus stability

## Coatema standard layout – one design among many available

Lips

Slot area

Manifold

Shim

## Structured coating – levels of complexity

	Web direction		Current status
1		Full area, homogeneous	Requirements are met, thickness profile variation of 0.5 %
2		Stripes downweb	Requirements are met, good edge definition
3		Stripes crossweb (intermittent coating)	Requirements are partially met, edge definition of 0.5 – 1 mm depending on liquid
4		Arbitrary patterns	Requirements are not met, concepts for realization exist, research project is going on

## Level 2 – downweb stripes

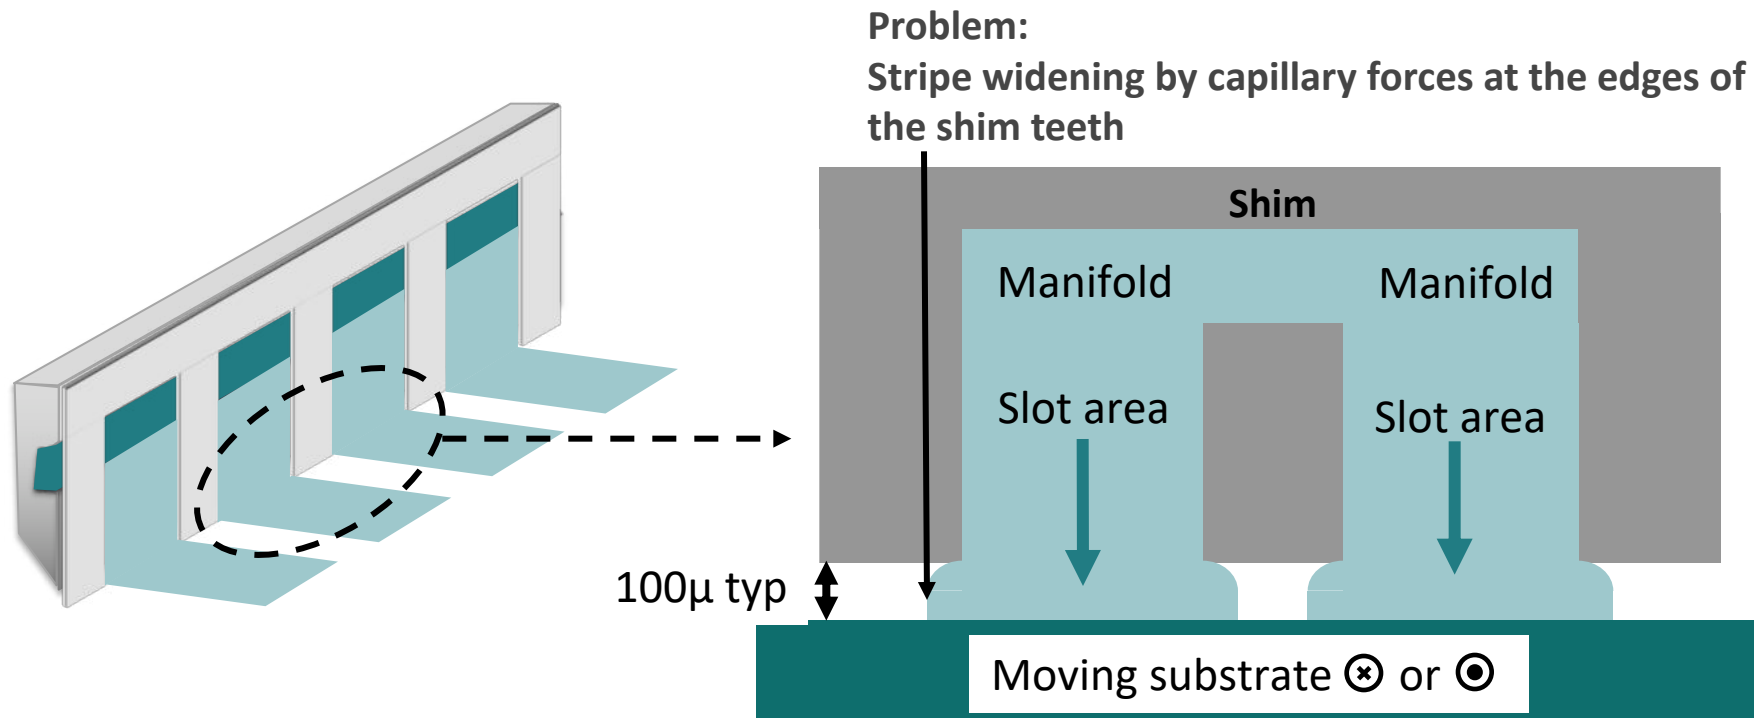

Downweb stripes of different width ...

... are made by appropriate shims, lasercut from steel or kapton

## Level 2 – downweb stripes

## Level 2 – downweb stripes

Manifold + Shim + Meniscus guide = well defined stripes

## Level 2 – downweb stripes

Meniscus guide

Shim

Meniscus guide + shim

## Standard techniques for intermittent coating

### **Pump:**

stop – reverse – restart

### **Slot die body:**

move back – move forth to minimum gap –  
move back to working gap (wedge procedure)

### **Slot die internal:**

stop and redirect the flow by shutters and  
valves. Pump flow continues, die flow stops.

All 3 techniques (single or in combination) work quite well, if the viscosity is rather high and the required edge definition is not more precise than around 1 mm. All techniques may be combined with a vacuum pump upstream to stabilize the meniscus and suck away residual liquid.

## Structured coating – reason for bad edges at low viscosity

- ✓ Meniscus has to be interrupted
  - ✓ Low viscous liquids do not break along a straight line
  - ✓ Meniscus has to be sucked back and restored
  - ✓ Speed is of essence
- For low viscosity, all of the three methods are too slow and too indirect

## Structured coating – the switching slot die lip

Slot die with movable lips:  
coating mode

coating works as usual

L lip  
V slot volume  
B bendable lip  
S bending slot

## Structured coating – the switching slot die lip

**Slot die with movable lips:  
stop mode**

Bendable lip B flips open

Volume V increases and sucks  
away the meniscus

L lip  
V slot volume  
B bendable lip  
S bending slot

## Structured coating – technical implementation with Piezo-Drive

Extremely fast action:  
within few ms from coating to  
stop mode and vice versa

Control  
Voltage

Piezo  
Response

## Structured coating – technical implementation with bendable lips

## Structured coating – stages of lip motion

## Slot die chamber – Simulation of anode Coating

- ✓ Example for anode electrode coating
- ✓ Fluid data taken from real world (shear-thinning power law fluid)
- ✓ Process parameters for 90m/min 400μm coating and 300mm width
- ✓ No „fancy“ slot-die „just“ Coatema standard

## Slot die chamber – Streamlines and pressure distribution

Single Chamber with too small inlet (4 mm)

Single Chamber with correct chamber layout (10 mm inlet)

Dual chamber slot die (8 mm inlet same dead volume)

## Slot die chamber – Meniscus makes or breaks homogeneity

# 6.

## Drying technologies for 3<sup>rd</sup> Gen PV

## Introduction thermal drying – Coating parameters

Coating chemistry	Coating processes	Process control	Drying
<ul style="list-style-type: none"> <li>✓ Rheology</li> <li>✓ Viscosity</li> <li>✓ Viscoelasticity</li> <li>✓ Type of solvents</li> <li>✓ Solid content</li> <li>✓ Van der Waals force</li> <li>✓ Sheer ratio</li> <li>✓ Adhesion/Cohesion</li> </ul>	<ul style="list-style-type: none"> <li>✓ Coating systems</li> <li>✓ Single or multilayer coatings</li> <li>✓ Direct coatings</li> <li>✓ Transfer (indirect) coatings</li> <li>✓ Substrate speed</li> <li>✓ Layer thickness</li> <li>✓ Coating accuracy</li> </ul>	<ul style="list-style-type: none"> <li>✓ Process layout</li> <li>✓ Tension control system</li> <li>✓ Material guiding system</li> <li>✓ Inline parameter control</li> <li>✓ Quality control</li> </ul>	<ul style="list-style-type: none"> <li>✓ Convection drying</li> <li>✓ Contact drying</li> <li>✓ Infrared drying</li> <li>✓ Sintering</li> <li>✓ NIR</li> <li>✓ High frequency</li> <li>✓ UV crosslinking systems</li> </ul>
Substrate	Pretreatment	Environment	Finishing

## Dryer specs needed for the layout

### Information about the substrate

- ✓ Web weight – weight per unit area
- ✓ Web material
- ✓ Specific heat of web
- ✓ Temperature limitations
- ✓ Operating web tension – tension sensitivity
- ✓ Special characteristics

Soucre: Drytec

## Introduction thermal drying – As general as possible(!?)

- ✓ Heat Conduction/ Heat Diffusion
- ✓ Heat Convection/ **Mass Transfer**
- ✓ Radiation

Substrate

Coating

Heat transfer

Evaporating solvent

Solvent vapor transfer

**Mass Transfer**

## Basics mass + heat transfer – Drying dynamics: Hot air drying

- ✓ Heating and vapor transport combined
- ✓ Bulk heating by thermal conductivity from surface
- ✓ Isolating layer to be overcome by air flow
- ✓ High air flow deteriorates surface
- ✓ Temperature easy to limit
- ✓ Slow

## Industrial drying systems

## Drying topics – drying technologies: HighDry HD500

Web behaviour in a  
flowtation dryer

Click on the picture to show the video

## Drying topics – drying technologies: HighDry HD500

The temperature-controlled circulating air exits  
As an additional function, DRYTEC offers  
adjustable bypass openings integrated in the  
side profiles of the FLOATEC nozzles.

This function is often used, for example, in  
processes with low-viscosity coatings.

Hereby the operator is able to set different air  
volume outlets from the bottom to the side.

## Summary

## Outlook

### Needed for success:

- ✓ Reproducible results in every step of scale?
- ✓ Reality check if the approach is really scalable?
- ✓ Is the approach an approach for the real life production environment or is it rocket science?
- ✓ Are economies of scale reachable and when?
- ✓ Is durability really needed?
- ✓ Standardization of device manufacturing is the key for the industry
